Education

University of Wisconsin Madison **Sep. 2022 – Dec. 2025**

Bachelor of Science in Computer Science, Minor in Game Design GPA: 3.92 / 4.0

- *Relevant Coursework*: Operating Systems, Computer Vision, Big Data, Algorithms, Data Structures, Machine Organization, Intro to AI, Object Oriented Programming, UI/UX

Technical Skills

Languages: Java, Python, TypeScript, JavaScript, SQL, C/C++, HTML/CSS, Swift, C#
Frameworks & Libraries: Spring Boot, Django, gRPC, React, Next.js, REST APIs, Node.js, PyTorch, Tensorflow
Technologies & Tools: AWS, GCP, Docker, Kubernetes, Kafka, Spark, Hadoop, Terraform, CI/CD, PostgreSQL, MySQL, Git, JIRA, GitHub, Linux/Unix, Agile, Scrum, Bazel, SDLC, Unit Testing, LLMs, Claude code, Jenkins, Distributed Systems, OpenAI API, Embeddings models

Experience

Microsoft Redmond, WA

Software Developer May 2026 – Present

- Onboarded tier one enterprise partners and mirrored catalogs directly into OneLake across AWS, GCP, and Azure engines, while supporting connector integrations
- Extended internal microservices and APIs with service-to-service (S2S) token exchange and resolved cache invalidation bottlenecks to ensure metadata consistency
- Developed AI-driven developer tooling to automate SDLC workflows, accelerating team-wide testing, code reviews, and delivery cycles
- Built automated integration and end-to-end test suites across heterogeneous cloud environments to validate end-to-end shortcut reliability

Gemini New York City, NY

Software Developer Feb 2026 – Feb 2026

- Worked on internal full-stack admin platform using TypeScript, React, and Scala, strengthening error handling and improving system observability

Software Engineer Intern *Jun 2025 - Aug 2025*

- Redesigned Django-based backend microservice handling token activity, improving monitoring efficiency by 70% within a production system
- Led upgrade of Stripe payment APIs, refactoring legacy endpoints and implementing new billing workflows to improve transaction reliability and maintain compliance with updated SDK standards

Software Engineer Intern *Jun 2024 - Aug 2024*

- Built internal automation platform used by 800+ engineers, eliminating 10+ weekly hours of manual reporting via Django, AWS, and PostgreSQL, built for SDLC and Agile methodologies
- Developed an interactive team management dashboard within Slack with configurable reminders, automated prompts, and visualized work summaries, improving engineering lead oversight and team transparency

Bajaj Finserv Pune, India

Software Engineer Jul 2023 – Aug 2023

- Developed a spam detection microservice using Spring Boot, safeguarding 500K+ loan applications with 95% classification accuracy.
- Developed highly scalable Spring Boot microservice safeguarding 500K+ loan applications, contributing to mission-critical backend systems

Projects

Remnis

- Building a privacy first macOS desktop app using Tauri and a Python sidecar that captures developer workflow locally to create a searchable history, enabling users to query past tasks, errors, and work context
- Implementing a local semantic search pipeline using MiniLM embeddings and LanceDB, enabling time-aware and intent-based queries over a user's workflow history
- Adding an on demand AI layer combining vector retrieval, reranking, and a small local LLM to generate grounded summaries from retrieved evidence without sending data off device

Cogniflow

- Designed distributed backend data pipelines aggregating blockchain transactions into a scalable knowledge graph, enabling real-time analytics and API-driven querying
- Built vector-based retrieval pipelines using Supabase pgvector and OpenAI embeddings to enable semantic search, wallet clustering, and contract behavior detection across EVM chains
- Implemented event-driven indexers with TypeScript workers to continuously sync on-chain data, compute token-level activity metrics, and surface insights through an AI-powered query layer

Shelfwise

- Built comprehensive food tracking application using Python/OpenCV for receipt scanning with 98% OCR accuracy
- Developed scalable FastAPI microservice backend with Prisma ORM supporting real-time inventory synchronization and API-driven workflows and integrated OpenAI powered NLP assistant for hands free interaction and intelligent recipe suggestions
